Forescout eyeExtend for JAMF Plugin Configuration Guide v1.0

About the Jamf Plugin

Jamf is an enterprise endpoint security solution for Apple operating systems. It creates custom detections that protect computers with real-time monitoring for suspicious and unwanted activities, while measuring computers against the Center for Internet Security (CIS) benchmarks with security insights.

As described by [Jamf](#), their product ensures that only trusted users on enrolled, safe devices can access company data. This dramatically increases the security of your modern workplace while streamlining work for your users. The Jamf platform allows your users to feel empowered and productive, while also maintaining the highest levels of protection for your devices and sensitive company data — regardless of where work happens.
